

Independent-codec routing

One source patch selects one complete encoder → entropy → decoder chain

RGB source patches

same tile geometry
for all six codecs

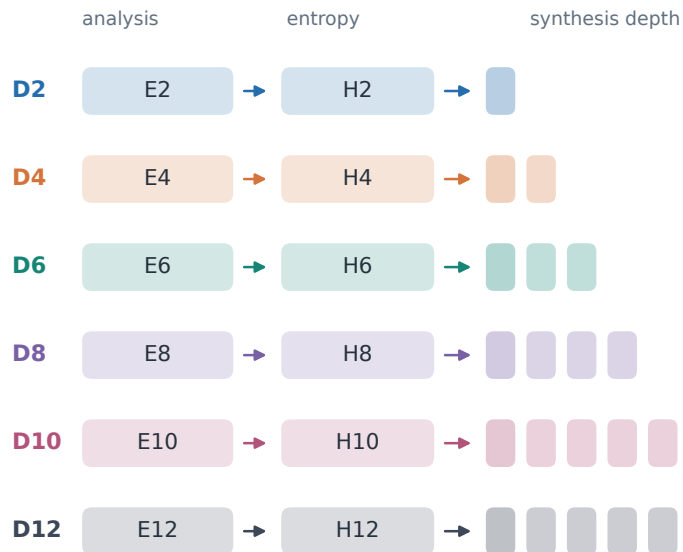

Encoder-side decision

- Y** luma / chroma
- ∇** edge / texture
- R** target rate
- T** time budget

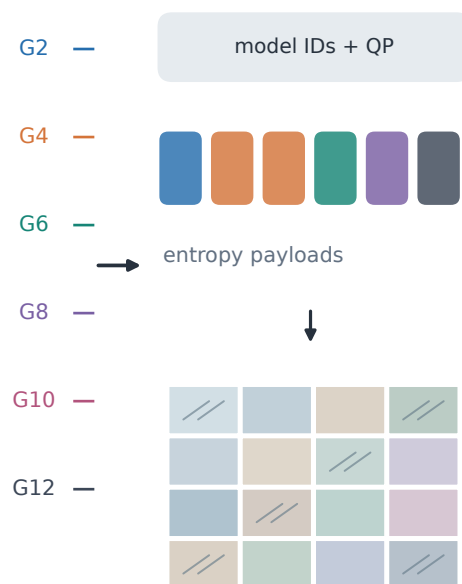

tiny MLP

Six independent codec paths

Independent weights and latents at every depth.

Transmitted stream

decoded + assembled image

Schematic only. Source-aware routing occurs at the encoder; the decoder reads the transmitted model ID. End-to-end time must include routing, entropy, transfers and assembly.
