

a Recover once; assign a stopping depth to each tile

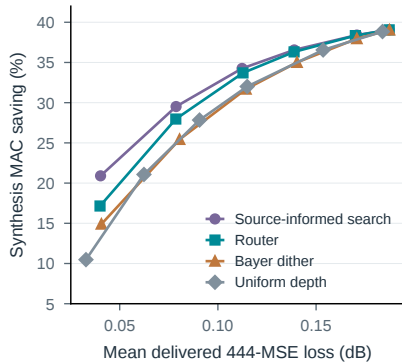

b Continue only the surviving tiles

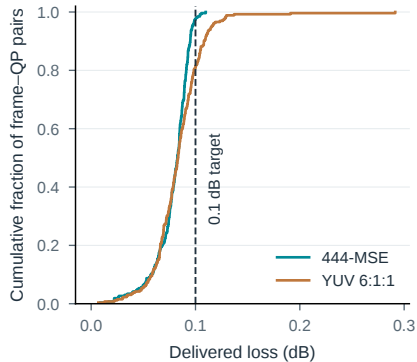

Pointwise exit adapters; deepest exit uses identity

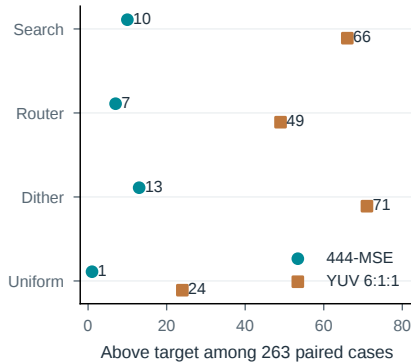

a Achieved quality differs across rules

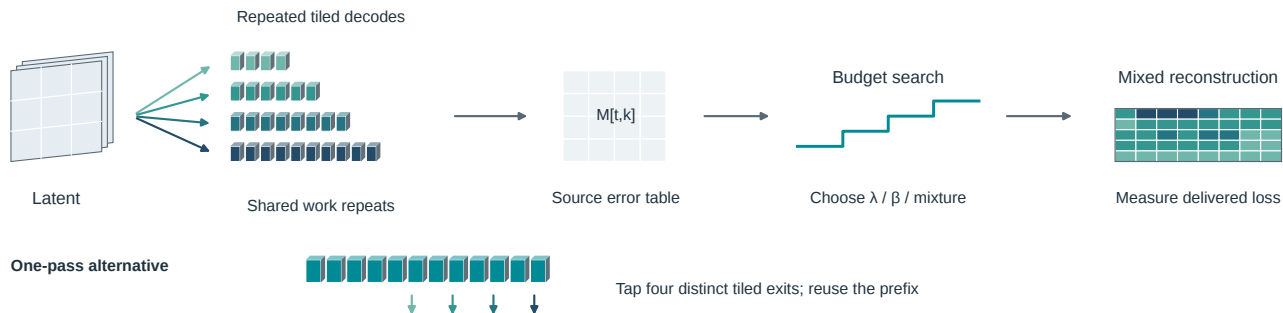

b Reporting differs from selection

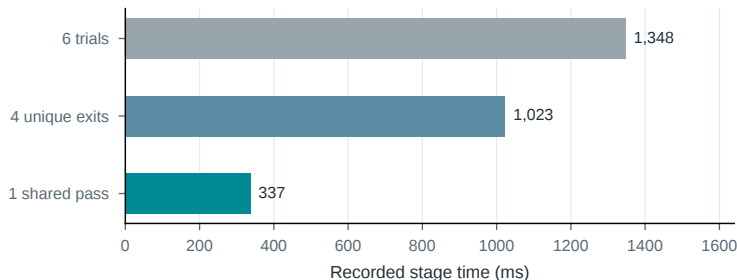

c Losses above the nominal target

a The source is available at the encoder, but the error table must be computed

b Recorded table construction time

Historical timing: 8 frames $\times$ 3 repetitions at QP32. No new end-to-end latency measurement.

c Calibration changes the cost

Fixed, held-out β

Router uses decoded features.
No per-frame source table is required.

Per-frame source-calibrated β

The plotted budget sweep uses $M[t, k]$.
A fast router does not remove that cost.

a One source, four allocations at the 0.1 dB target

executed trunk blocks

a Shared early exit: one representation, nested synthesis

b Independent depth controls: each codec learns its own representation

Same-recipe D12 is an additional control. The released anchor alone does not isolate depth.

c Later routing study: select before encoding; signal which expert owns the payload
