

B bitstream-identical

nothing is added to the file; the decoder recovers the map from what it already holds

the predicted map

The file is byte for byte the released one, so this is the only configuration that can be dropped in front of a bitstream encoded before the method existed.

And the only one that cannot guarantee the budget: it never sees the source, so it cannot measure what it is delivering.

mean MAC saving, 0.1 dB

24.69%

added to the bitstream

0 bits

router cost

0.163% of one decode
