

FLEX router

one exit per tile, from tensors the decode already holds

Trained by regret-weighted cross-entropy to the oracle's own choice: the weight is what the mistake costs, so capacity is spent where it matters.

Agreement with the oracle 78.7%, against 37.9% for the best constant choice; 76.2% held out. Total cost 0.163% of one decode.

The entropy model's scales are what v1 threw away, and the two signals most correlated with the oracle's choice live there.
